MUVIS

Glass plus Glass

Product Description:
The Light in Motion

Muvis is a state-of-the-art lighting system, completely innovative, entirely conceived and manufactured in Italy. It aims to revolutionize the perception of the home environment by creating an infinite number of lighting combinations and, consequently, an infinite number of different ambiances.

A sophisticated mechanism allows Muvis light source to be guided along two axes, each having a range of motion of over 180°. The beams of light can be adjusted in size, their intensity regulated and their color changed.

Thanks to remote control and the insertion of a tiny but powerful chip, each lamp responds to commands given within a distance of 40 meters. Each chosen setting (position, intensity and color of the light) can be memorized and reproduced as wanted. The system is able to memorize up to 20 different lighting combinations, command up to 128 lighting fixtures in the same area, and can also be used with lamps that are already present in the home, with one unique remote control.

The system's efficient integration allows to create numberless customized lighting scenes, so to change the environment in accordance with the occasion or the daytime hour: all the lamps move in synchronicity and settle to give life to a light-candle romantic dinner atmosphere, discoparty coloured surrounding, full light and so on...

Each lamp comes equipped with energy-saving devices. There are no special installation procedure and the system meets maximum safety standards. These characteristics make Muvis a hi-tech project that offers consumers the possibilities and technology that are typical of the lighting systems in theater and movie sets, at a highly competitive quality-price ratio.

The Muvis invention is an answer to consumers' growing sensitivity and interest for new horizons in living. In Muvis they will find domotics with functionality, user-friendliness, personalized features and low energy consumption.
